Iodine Deficiency

Developing a Tool to Detect Nutrient Deficiencies

Goals:

- Rapid
- Simultaneous
- Low Cost
- Durable
- Accurate

Can we develop one assay that can measure 5 micronutrients? **YES!**

Plasma Pencil Atmospheric Mass Spectrometry

3 technologies intersect!

(PPAMS)

$$\mathbf{B} = \begin{bmatrix} b_1 \\ b_2 \\ \vdots \\ b_m \end{bmatrix} = \begin{bmatrix} 1 & 0 & \cdots & 0 \\ 0 & 1 & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & 1 \end{bmatrix} = \mathbf{I}$$

Plasma Pencil Atmospheric Mass Spectrometry (PPAMS) System

Working towards an easily portable system

Bench-top MS

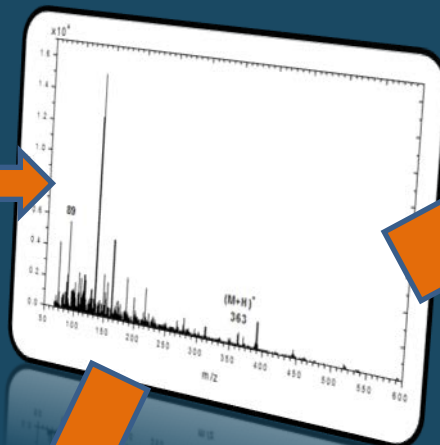

Portable MS

Data Analysis Workflow

1.5 mL Liquid in Petri Dish

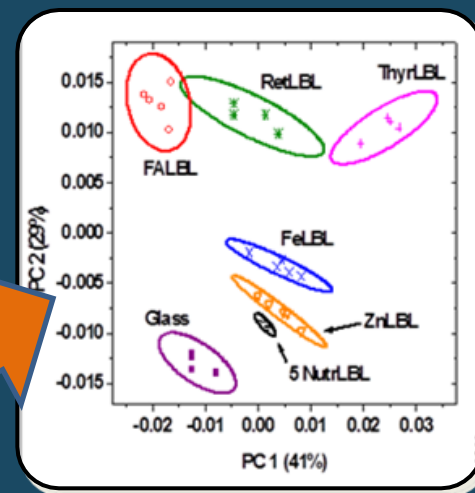

PPAMS

Regression
Software Program

20 μ L Spot on Paper

Folic Acid	%
Iodine	%
Iron	%
Vitamin A	%
Zinc	%

Results for Blood

The sample may now be removed from the prep chamber

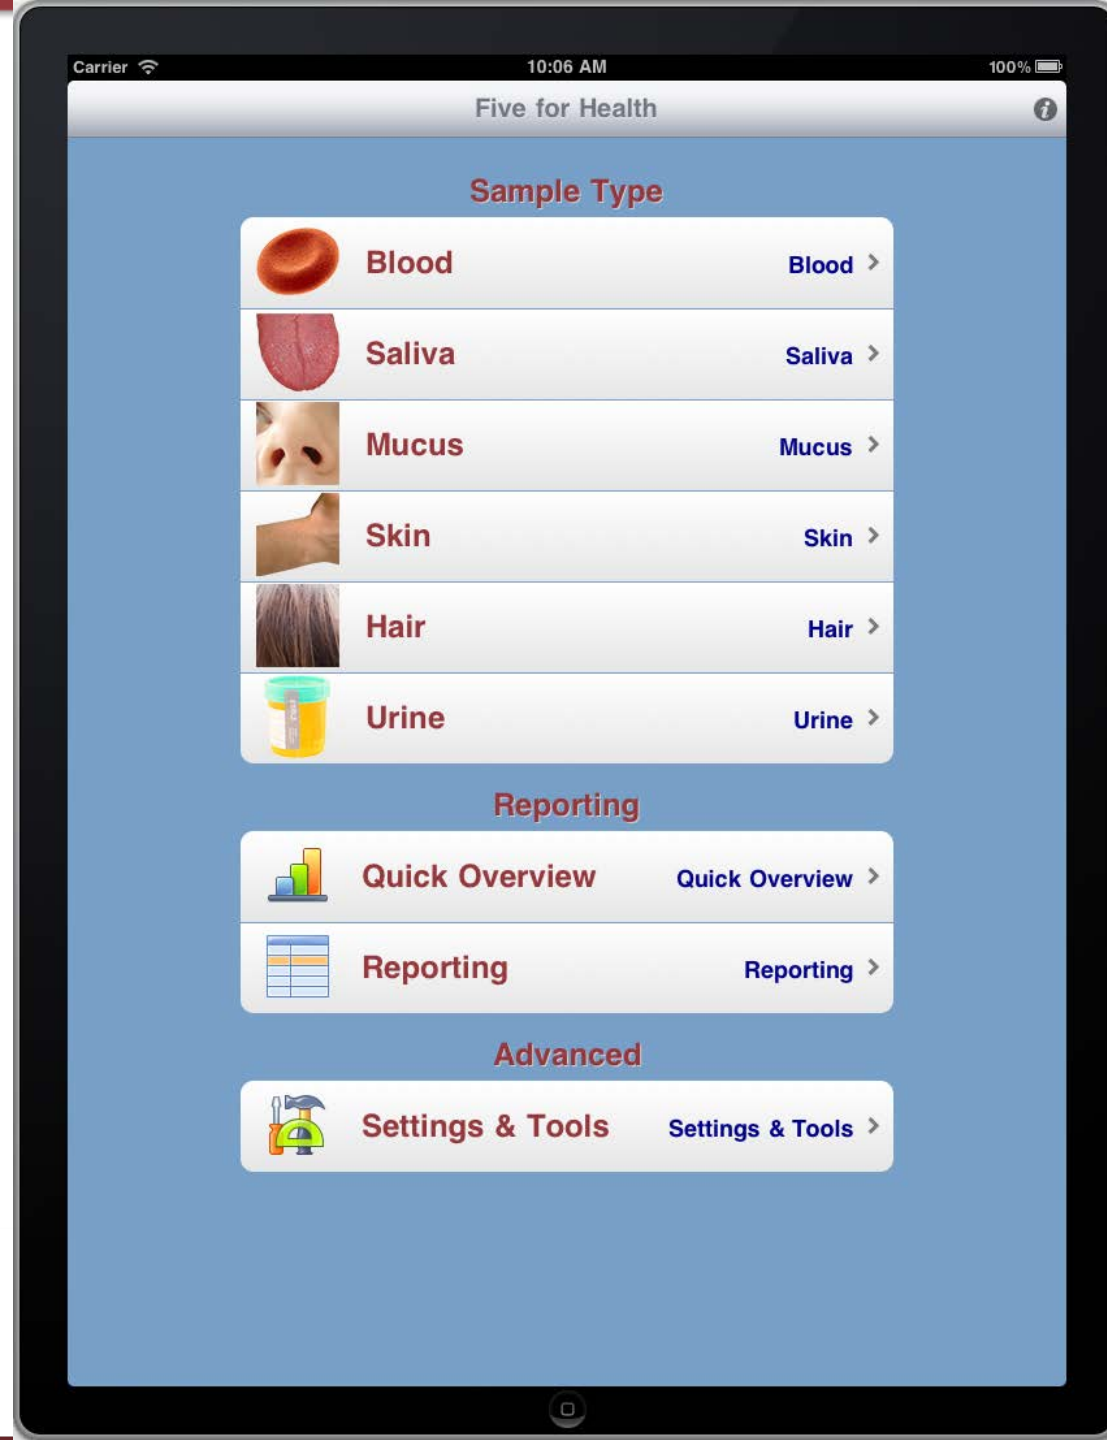

Mbomo Migunda, Male, 34yo

- Iodine
- Iron
- Zinc
- Folic Acid
- Vitamin A

Date: 3/16/2010
Time: 2:32PM
Location: 0° 3' 36.40" S
36° 54' 57.18" E
Notes: Nyadundo Village, Kenya

Graphical User Interface

Whole Blood

PPAMS was taken on raw nutrient powder and on dried blood samples

Adult human blood chosen as sample media to detect micronutrient levels

HBLC: High Blood Level Concentrations

For Each Nutrient Group:

- Iron: 2 ppm
- Zinc: 20 ppm
- Folic Acid: 50 ppb
- Retinol (Vitamin A): 625 ppb
- Thyroxine (Iodine): 105 ppb

LBLC: Low Blood Level Concentrations

For Each Nutrient Group:

- Iron: 0.5 ppm
- Zinc: 10 ppm
- Folic Acid: 5 ppb
- Retinol (Vitamin A): 288 ppb
- Thyroxine (Iodine): 46 ppb

PPAMS on Examples on Patient Models with Single Nutrient Variations

"Relatively Healthy"

For Each Nutrient Group:

- 1 Nutrient at 1x LBLC
- 4 Nutrient at 1x HBLC

Control:

- All Nutrients at 1x LBLC

Media:

- 10% Porcine Plasma in citrate Phosphate Buffered Saline

"Relatively Unhealthy"

For Each Nutrient Group:

- 1 Nutrient at 1x HBLC
- 4 Nutrient at 1x LBLC

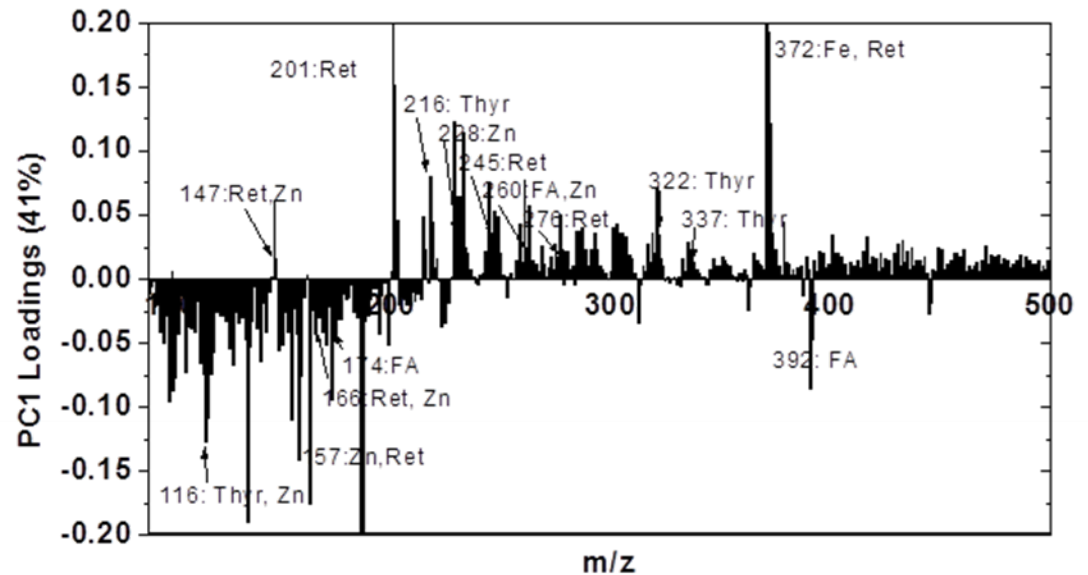

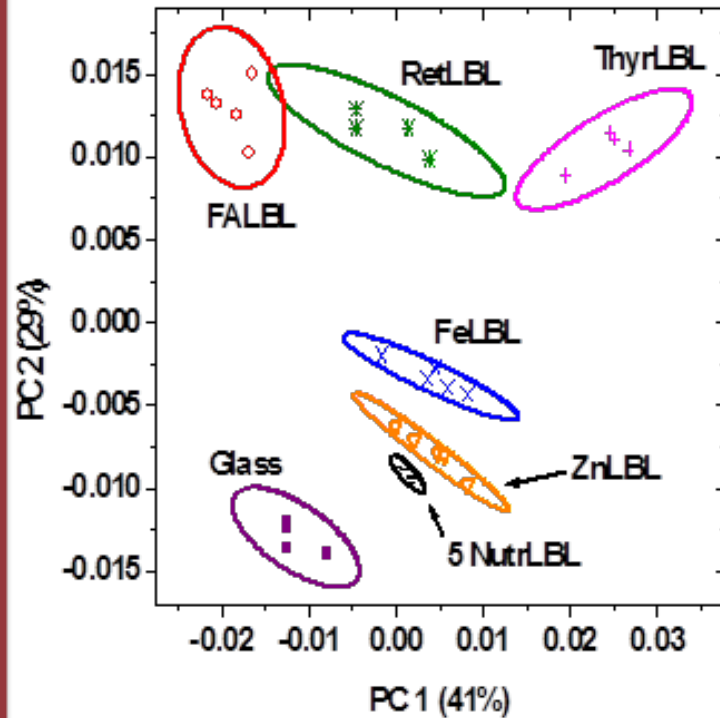

Control:

- All Nutrients at 1x HBLC

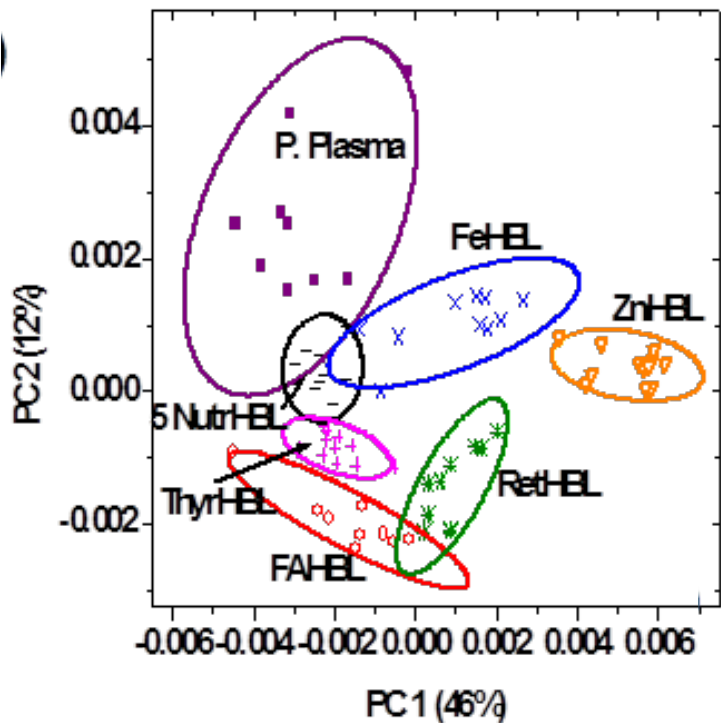

Media:

- 10% Porcine Plasma in citrate Phosphate Buffered Saline

"Relatively Healthy" sample groups separate nicely

“Relatively Unhealthy” sample groups separate reasonably well

If you utilize a more complex mathematical model...

Equations

Wavelet Transformation:

$$f(x) = \sum_{j,k \in Z} d_{j,k} \psi_{j,k}(x)$$
 Let $Y = (y_1, \dots, y_n)$, $n = 2^j$,
 $Z = WY$

Posterior Distribution of γ :

$$\pi(\gamma | Y, Z) \propto g(\gamma) = \frac{\|\hat{\mu}_\gamma\| \|Z_\gamma Z_\gamma + \hat{\mu}_\gamma\|^{-\alpha_2}}{\times |Q_\gamma|^{-(\alpha_1 + \alpha_2 + 1)/2} \sigma(\gamma)}$$

$$Q_\gamma = Q + Y Y' - Y Z_\gamma (Z_\gamma' Z_\gamma + \hat{H}_\gamma^{-1})^{-1} Z_\gamma' Y$$

$$\hat{Z}_\gamma = \begin{pmatrix} Z_\gamma \hat{H}_\gamma^{-1} \\ \hat{H}_\gamma \end{pmatrix}, \quad \hat{V}_\gamma = \begin{pmatrix} \hat{V}_\gamma \\ \hat{H}_\gamma \end{pmatrix}$$

$$\|\hat{\mu}_\gamma\| \|Z_\gamma Z_\gamma + \hat{\mu}_\gamma\|^{-1} = |\hat{Z}_\gamma' \hat{Z}_\gamma|$$

$$Q_\gamma = Q + \hat{V}_\gamma \hat{V}_\gamma' - \hat{V}_\gamma \hat{Z}_\gamma (\hat{Z}_\gamma' \hat{Z}_\gamma)^{-1} \hat{Z}_\gamma' \hat{V}_\gamma$$

Metropolis Search:

$$\min \left\{ \frac{g(\gamma^*)}{g(\gamma)}, 1 \right\} \rightarrow \hat{V}_\gamma = \sum_\gamma Z_\gamma \hat{H}_\gamma \sigma(\gamma | Z, Y)$$

Prior Multivariate Linear Regression Model:

$$Y - I_n \alpha' - XB \sim \mathcal{N}(L, \Sigma)$$

$$\alpha' - \alpha'_0 \sim \mathcal{N}(h, \Sigma)$$

$$B - B_0 \sim \mathcal{N}(H, \Sigma)$$

$$\Sigma \sim \mathcal{IW}(\delta; Q)$$
 Transformed into Wavelets:

$$Y - I_n \alpha' - XW B \sim \mathcal{N}(L, \Sigma)$$

$$Y - I_n \alpha' - Z \tilde{B} \sim \mathcal{N}(L, \Sigma)$$
 where $Z = XW'$

$$B = W \tilde{B} \quad \tilde{B} \sim \mathcal{N}(\tilde{H}, \Sigma)$$

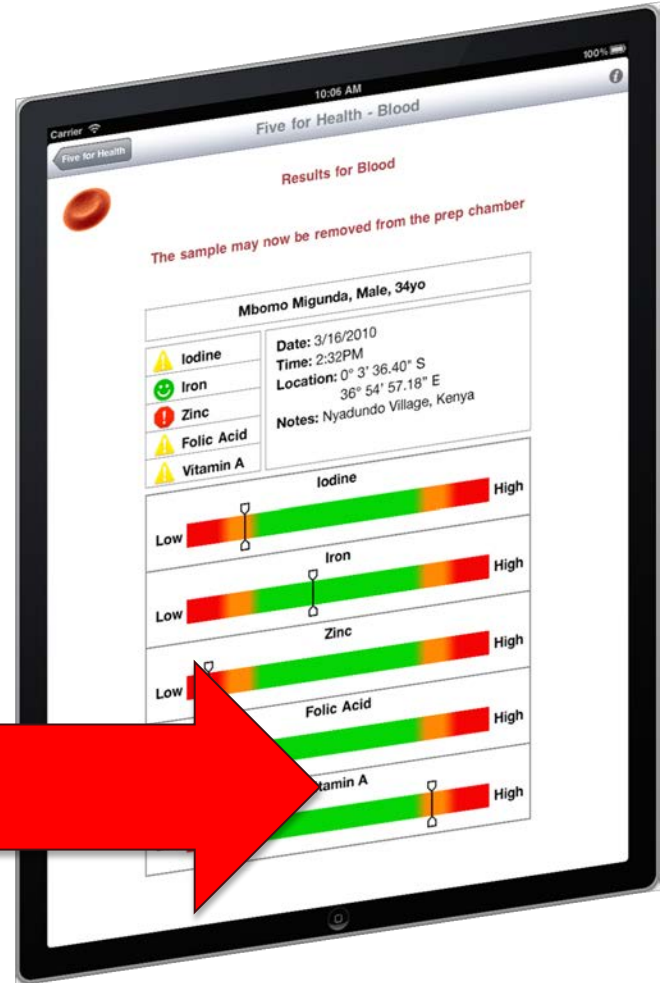

$$\tilde{H} = W H W'$$

$$[\tilde{B}]_{l,j} \sim (1 - \gamma_j) I_0 + \gamma_j N(0, \hat{h}_j \Sigma)$$

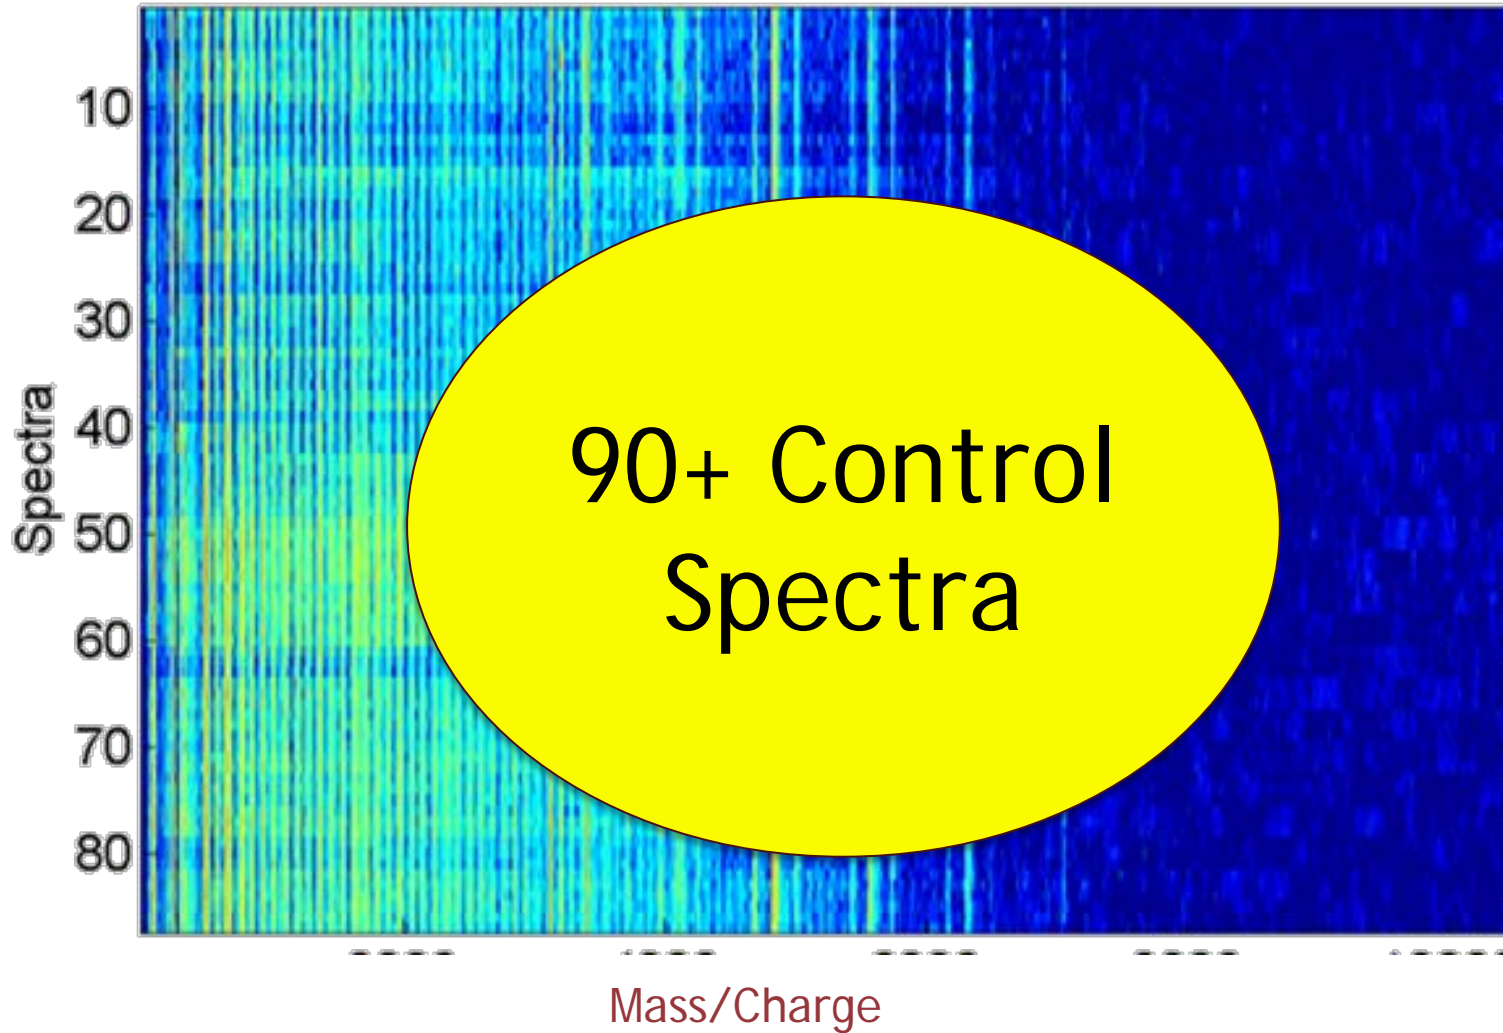

$$f \propto |K|^{-q/2} |Q|^{[(\delta + q - 1)/2]} |Q + Y K^{-1} Y'|^{-(\delta + q - 1)/2}$$

$$K = I + X H X'$$

$$\Pr(\gamma_j = 1) = w_j \text{ and } \Pr(\gamma_j = 0) = 1 - w_j$$

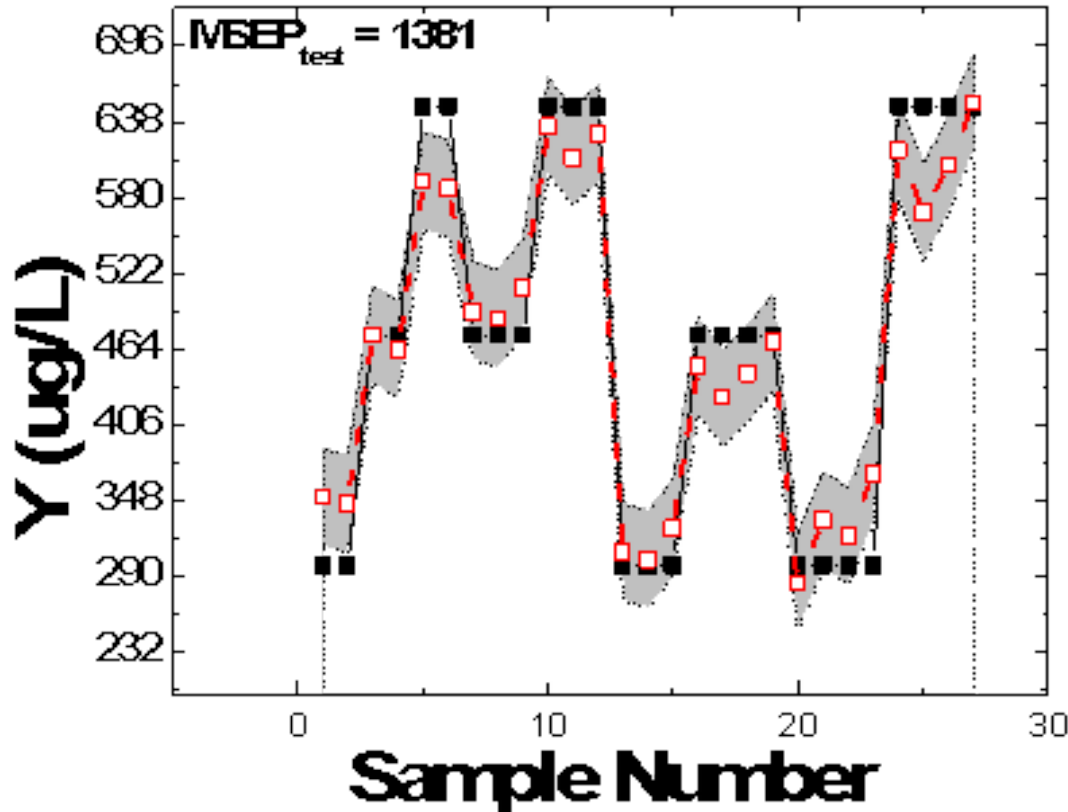

... And utilize a large number of spectra as controls...

... then one can begin to move from the qualitative to the quantitative

VitA

- Predicted Value
- Actual Value
- Matrix: Porcine Plasma

Strategic Advantages

- PPAMS was rapid (~3-5 min), ~20 uL solution
- Physiological range of micronutrients in blood was within spectrometer detection range even in the presence of salt and proteins
- Multivariate PCA yielded simultaneous separation of the nutrients by type and quantity at both the lower ranges expected for a “malnourished” individual and at the higher ranges expected for a “well-nourished” individual.

Disruptive Technology for Measuring Nutrients and Nourishment

Venturing forth to measure new biological sample types

Physiology of Hair

PPAMS was taken on a fresh hair and cleaned hair samples

Hair obtained from donor

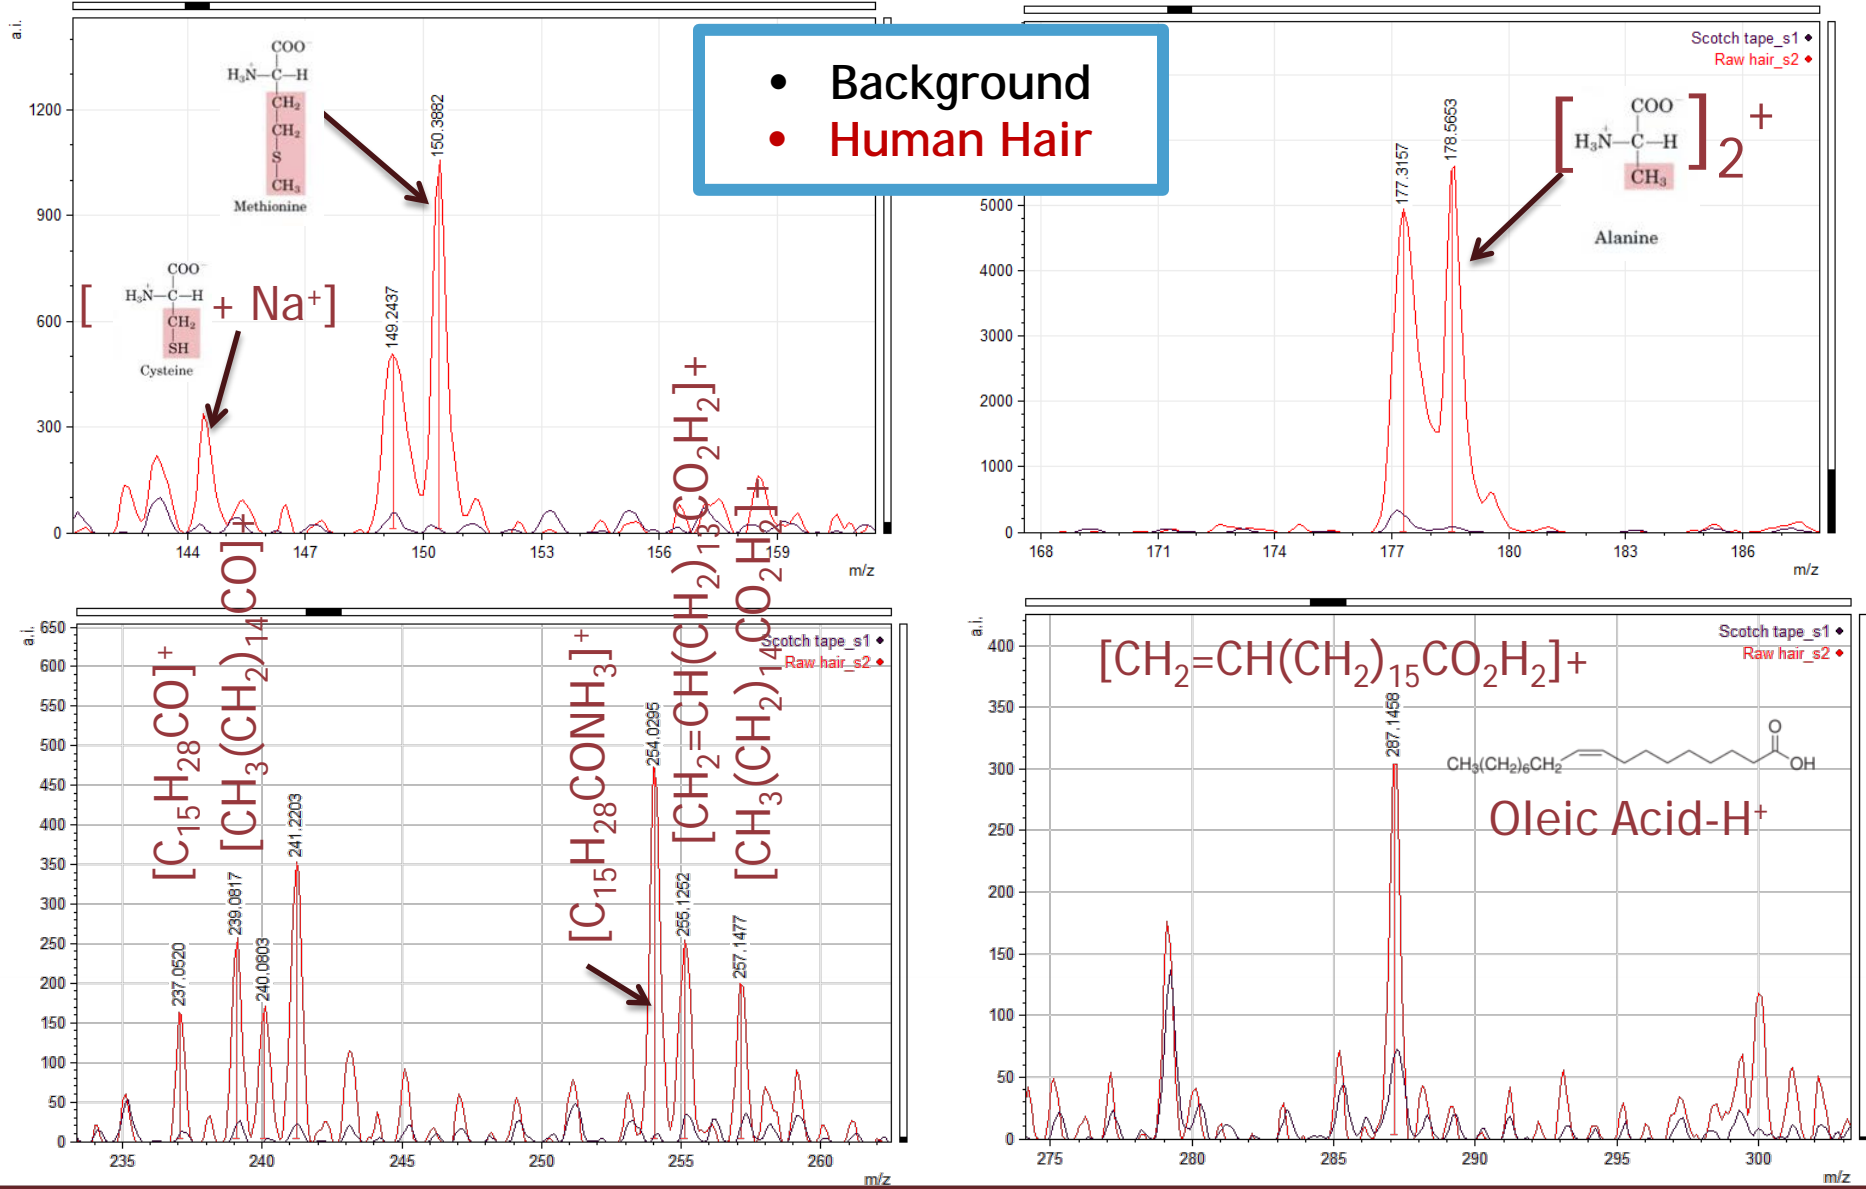

Analyzed "as-is"

Analyzed via PPAMS

Several peaks were found to be present only in the sample of human hair

PPAMS was taken on a fresh fingernail clippings

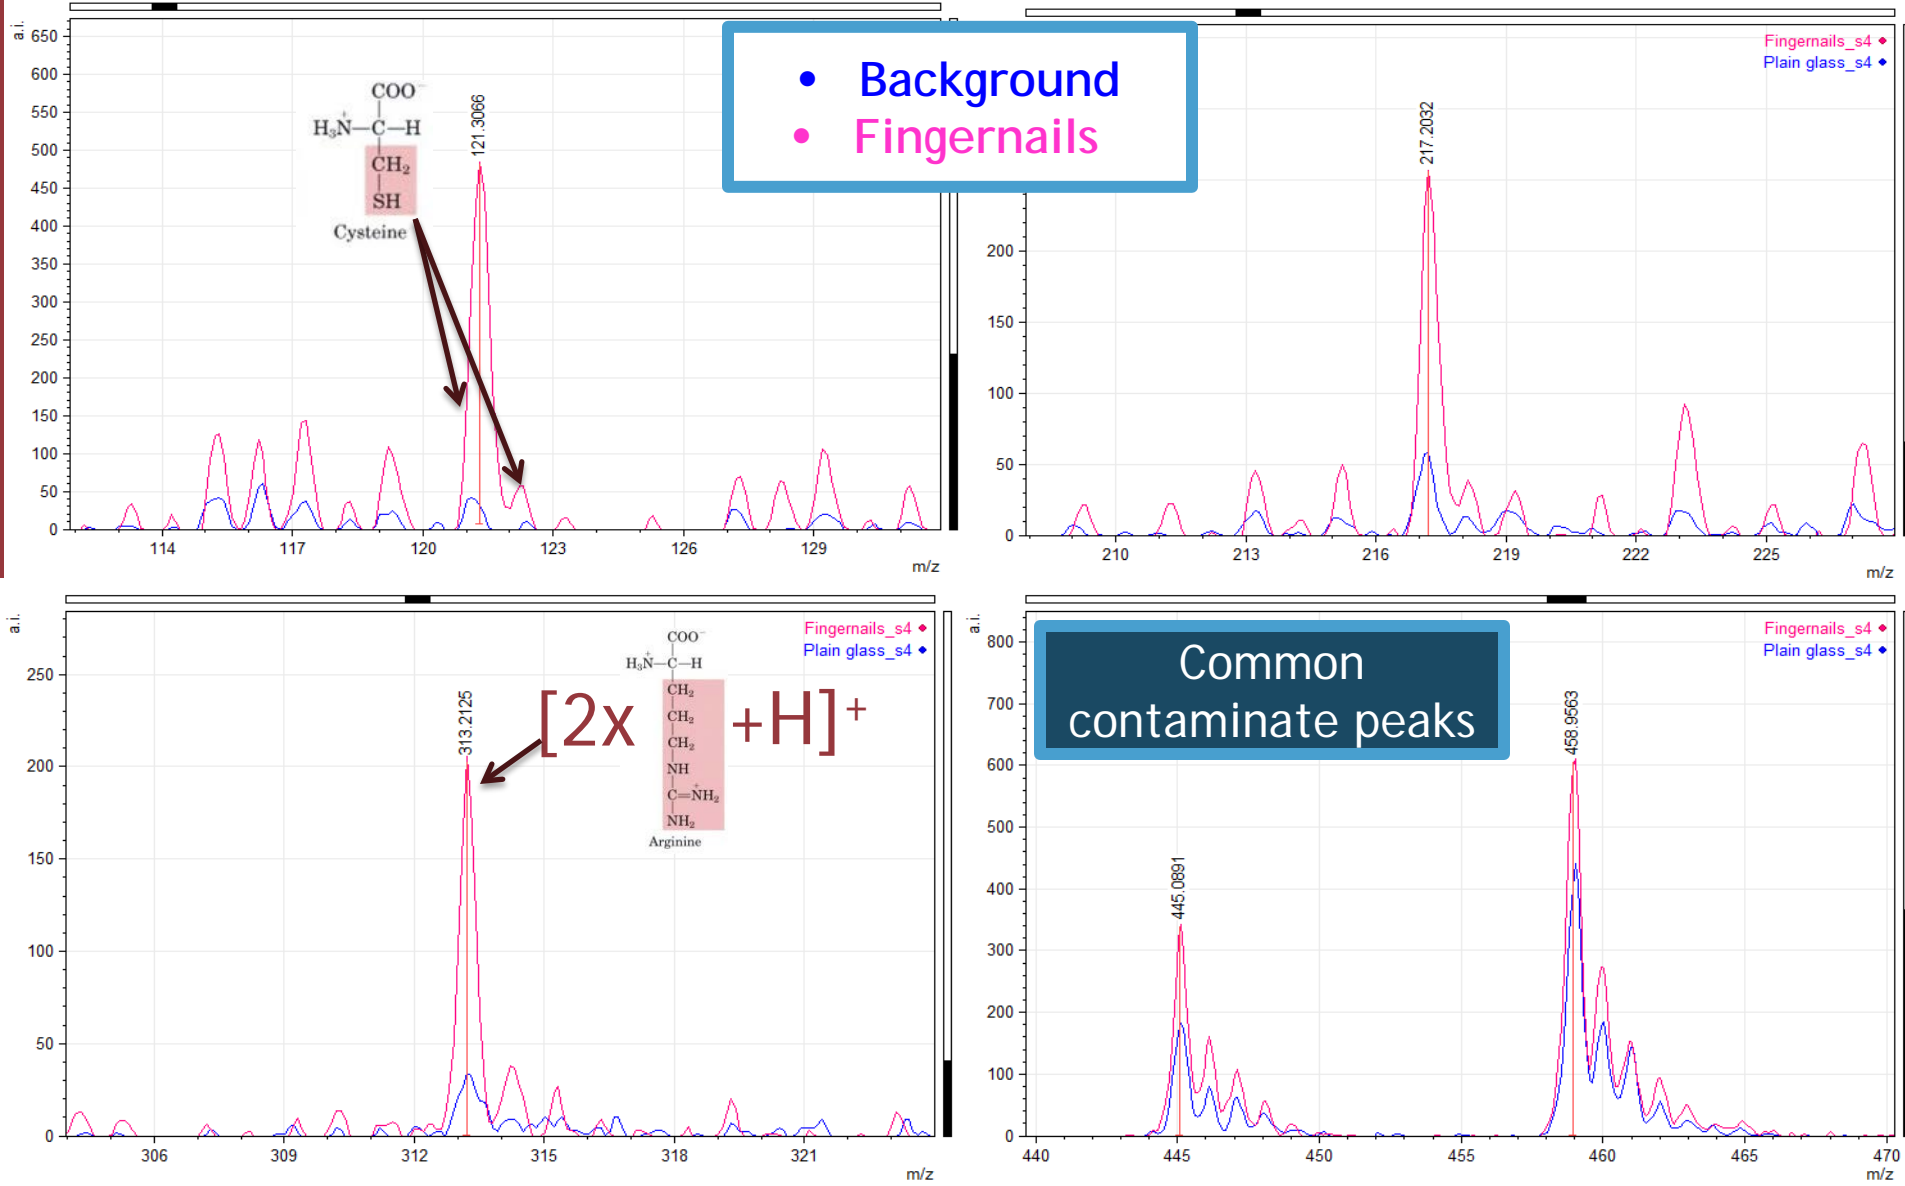

Fingernail clippings
taken from healthy
donor

Washed with 2% Triton X
Solution: Water , Acetone
Rinse

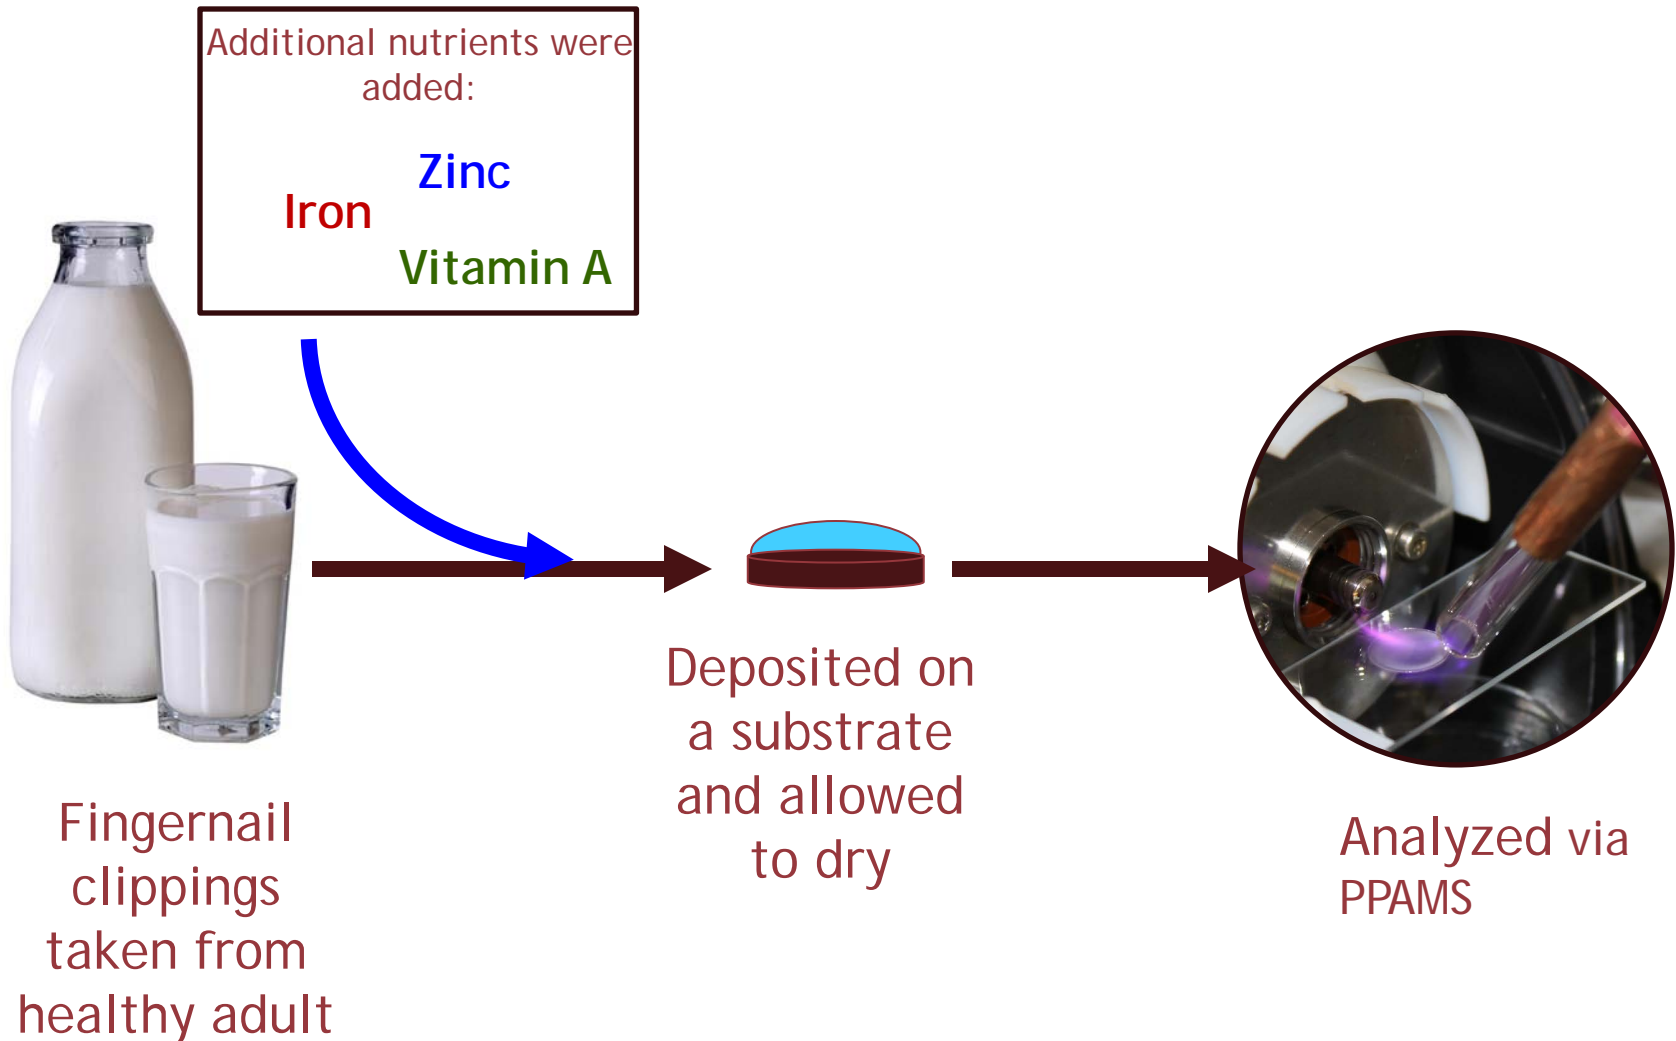

Analyzed via PPAMS

Several peaks were found to be present only in the sample of human fingernails

PPAMS was taken on samples of raw, unpasteurized cow's milk with and without nutrient doping

PPAMS was able to distinguish changes in vitamin A and iron content in unpasteurized, raw cow's milk

Venturing forth to measure new biological sample types

What is the best measurement of nourishment in a population?

Multivariate Data Analysis

Analytical and clinical chemistry generally focuses on one test to measure each analyte?

Can we measure many things simultaneously?

Micronutrient mass spectra successfully separated by PCA

Scores Plot

Loadings Plot

PCA data for mixed samples with four nutrients at 1xHBLC and one nutrient at elevated 10x HBLC

You can't manage what you can't
measure

George Soros

To measure is to know

Lord Kelvin

How such analysis is done now:

Powerful tools for data analysis...multivariate analysis

Why Use Multivariate Data Analysis?

- It is difficult to identify people based only on their heights, weights, eye color or hair color...
- ...however, given all this information, identification becomes easier

PCA - Principal Component Analysis

What are the important differences and key identifiers of different samples?

Separate the signal from the "dross"

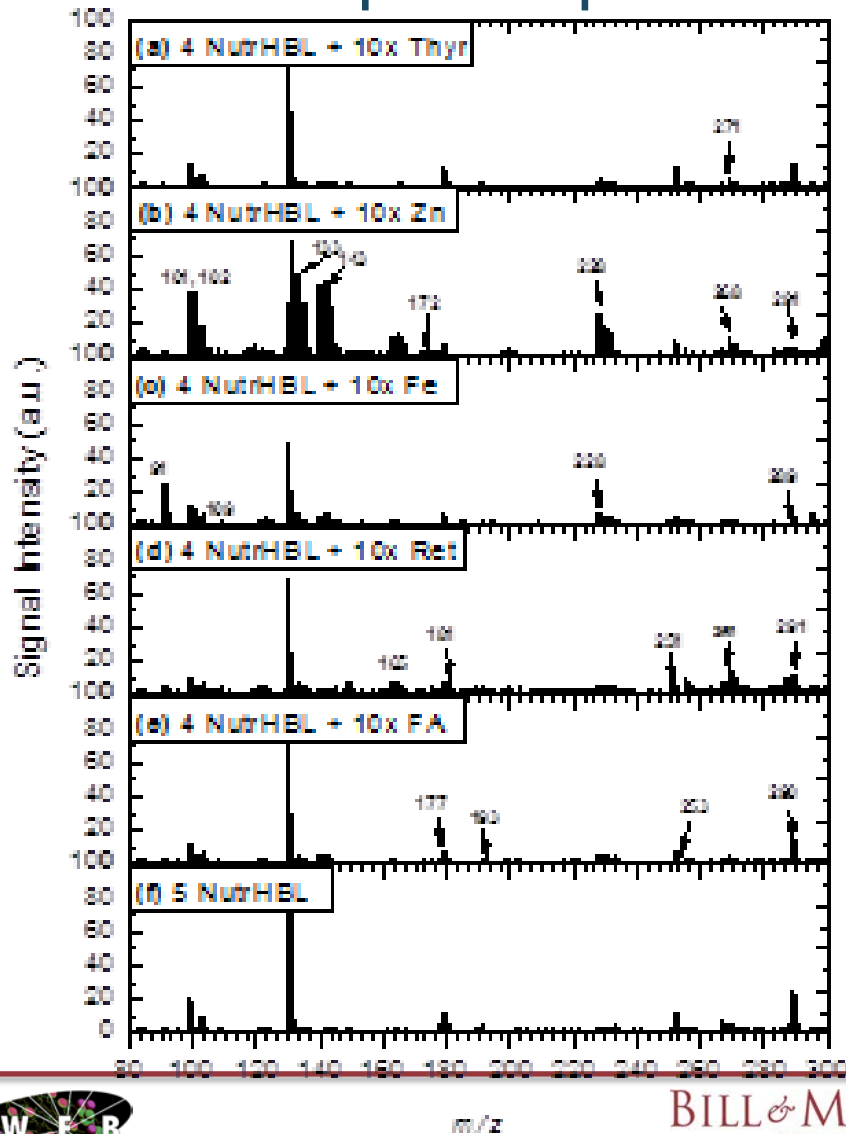

PLS - Partial Least Squares

Develop a quantitative calibration model

Plasmas (physics)

Positive ion ESI-MS spectra separation includes many of the peaks present in raw powder spectra

(multi-component mixtures consisting of one nutrient at a 10-fold concentration of its HBL concentration and the remaining four nutrients at a 1x HBL concentration)

- Each spectrum had signature peaks for the respective nutrient as confirmed by raw nutrient spectra (data not shown).
- The presence of the other nutrients did impact some key nutrient peaks
 - Ex. Peak at 777 for Thyroxine by itself disappears in mixed solutions.
